

# Renewable Energy Planning

The UK Draft Renewable Energy Strategy of 2008 refers to the need having been identified for around 4,000 new 3 MW onshore wind turbines in addition to those already installed in the UK. This will serve to reinforce the considerable interest in the development of wind farms in the UK for the foreseeable future.

At England and Lyle, we have considerable experience in dealing with renewable energy proposals including onshore wind development and hydro electric schemes for both local authority and public sector clients; working in both England and Scotland.

We are pleased then to be able to offer our services in respect of:

- Initial site assessments
- EIA Screening and Scoping Opinions
- Community consultation
- Preparation of planning applications for renewable energy developments
- Problem solving regarding planning applications
- Negotiation with Local Planning Authorities
- Planning policy advice
- Drafting of planning conditions
- Discharge planning conditions
- Planning appeals, inquiries and hearings
- Advice and training

England & Lyle therefore have a thorough understanding of wind farm proposals and the planning processes and regulations and can offer cost-effective, expert planning services in relation to onshore wind turbines.
